AUTHORS: Eygenson, M. S., Mandrykina, T. L.

TITLE: Fluctuation index of solar activity, 11-year cycle and fluctuation regime of geophysical fields

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 10, 1962, 57-58, abstract 10A394 ("Tsirkulyar Astron. observ. L'vovsk. un-ta", 1960, no. 35 - 36, 64 - 74)

TEXT: The authors introduce new fluctuation indices of solar activity, which represent successive first differences of the selected absolute parameter of solar activity. They present the catalogue of fluctuations in monthly values of sunspot areas and Wolf numbers from 1874 to 1954. They conclude that an average level of solar activity is explained by the average background of solar-geophysical phenomena. The average amplitude of temporal fluctuations in parameters of solar-geophysical phenomena is apparently related to the fluctuation index of solar activity.

TITLE: Normal system of solar activity indices

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 6, 1962, 8, abstract 6G41 (Tsirkulyar. Atron. observ. L'vovsk. unta, no. 35-36, 1960, 75-77)

TEXT: Taking into account the large quantity of observations of solar activity indices and the need for a completely homogeneous and precise series of activity indices, the authors reckon that it is necessary to revise the existing system of indices. For this the authors suggest that the existing series of observations should be unified, and also that an international system should be created for the normal values of the solar activity indices. It is proposed that the observations of each solar observatory should be analyzed from a single point of view, and that a final composite international normal catalog should be created. *[Abstracter's note: Complete translation.]* ✓

TITLE: Numbers of empty and full days as functions of phases of 11-year  
and secular cycles of solar activity

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 10, 1962, 58,  
abstract 10A396 ("Tsirkulyar Astron. observ. L'vovsk. un-ta", 1960,  
no. 35 - 36, 87 - 90)

TEXT: It is shown that the number of days in a year when there are no  
sunspots on the Sun varies during the secular and 11-year cycles. The number  
of such "empty" days is the largest near the epoch of solar activity minimum,  
and a maximum of the number of empty days coincides exactly with the data of  
11-year cyclic minimum. Moreover, the summary number of empty days, calculated  
for cycles no. 14 - 18 shows a secular variation toward decreasing the number of  
empty days from cycle to cycle. The number of days when sunspots were observed  
on the Sun is also depending on the phase of the 11-year cycle, dates of both  
minima coinciding exactly. The summary number of full days during one cycle

TITLE: On intercorrelation of some summary characteristics of 11-year cycles

PERIODICAL: Referativnyy zhurnal, Astronomiya, no. 3, 1963, 62, abstract 3-51-451 ("Tsirkulyar Astron. observ. L'vovsk. un-ta", 1962, no. 37 - 38, 80 - 81)

TEXT: The author studied intercorrelation of some summary characteristics of 11-year solar activity cycles during the period from 1700 to 1953. The analysis of the regularities obtained led to the conclusion that the principal role, among all summary characteristics, belongs to duration of the ascending branch of an 11-year solar cycle. It determines, in general, the maximum power of the cycle and duration of the descending branch.

TITLE: On the ascending branch of the current secular cycle of solar activity

PERIODICAL: Referativnyy zhurnal, Astronomiya, no. 2, 1963, 56, abstract 2.51.442 ("Tsirkulyar Astron. observ. L'vovsk. un-ta", 1962, no. 37 - 38, 82 - 90)

TEXT: The authors analyze the ascending branch of the current secular cycle of solar activity. Tables of various characteristics of solar cycles, starting from 1700, are presented. It is shown that the current secular cycle is not similar, morphologically, to the preceding secular cycle, but shows more likeness with the cycle before the preceding one. A principal conclusion of one of the authors is confirmed, which sounds as follows: The secular change of solar activity consists in the secular change in the course of the distribution curve of solar phenomena intensity. There are 7 references.

TITLE: The asymmetry coefficient of an 11-year solar cycle and its secular periodicity

PERIODICAL: Referativnyy zhurnal, Astronomiya, no. 2, 1963, 56, abstract 2.51.443 ("Tsirkulyar Astron. observ. L'vovsk. un-ta", 1962, no. 37 - 38, 91 - 95)

TEXT: The authors introduce two versions of the asymmetry coefficient of 11-year solar cycles: 1) the ratio of times of decrease and growth of the cycle; 2) the ratio of areas of the Wolff curve under the decrease branch and under the growth branch (approximately: the ratio of the sums of Wolff numbers during the decrease branch and the growth branch). Using the data from 23 11-year cycles (1700 - 1953) the authors show that both versions of the asymmetry coefficient have a distinctly pronounced secular periodicity and are rather closely intercorrelated; correlation coefficient is equal to +0.915.

TITLE: Indices  $\sum S_{\max}$ ,  $\bar{S}_M$ ,  $\bar{S}$  in the current cycle

B

SOURCE: Ref. zh. Astronomiya, Abs. 1.51.454

REF SOURCE: Tsirkulyar Astron. observ. L'vovsk. un-ta, no. 41, 1964, 31-34

TOPIC TAGS: sunspot cycle, sunspot, solar cycle

ABSTRACT: The values of the indices  $\sum S_{\max}$  (sum of the maximum values of sunspot groups per year),  $\bar{S}_M$  (average annual maximum area of spot groups), and  $\bar{S}$  (daily mean area taken over a spot group for each year) for the whole sun and for each hemisphere are presented according to material of "Solar data" for 1955-1964. Asymmetry of the northern and southern hemisphere, unusual for the decay side of the cycle, is noted. T. M. [Translation of abstract]

"Scattered Form of Hydrocarbon Occurrence in Various Sedimentary Rocks," V. A. Yspenskiy,  
A. S. Chernysheva, Yu. A. Mandrykina, 17 pp

"Iz Ak Nauk SSSR, Ser Geol" No 5

Concludes that scattered form of hydrocarbons in sedimentary rocks is considerably more prevalent than concentrated form of bitumens in the total mass of probable petroleum stores of the entire earth. From personally gathered material and literary data, determined that quantity of hydrocarbons in the scattered form is 10,000 times greater than total petroleum stores known.

ABSTRACT: A crust of white crystalline substance has been found on  
the exposed surface of an ancient tree trunk in fossil  
woody material (lignite) in the region of Zelenskiy's  
gora (Mountain) on the shore of the Black Sea. The  
crystalline substance is locally continuous, locally  
consisting of individual bands and spots. A chemical  
analysis and also spectral absorption have shown that  
this crust is composed of an organic mineral, sneererite  
no initial

TOPIC TAGS: flight speed measurement, drift angle measurement, four-beam antenna, Doppler effect

QM

ABSTRACT: The proposed system is based on the use of the Doppler effect in the continuous radiation and reception of electromagnetic waves by a four-beam antenna. Measurement accuracy is improved by simultaneous reception of coherent signals from two points on the terrain swept by a pair of antenna beams. For this purpose, as well as to reduce the weight of the unit, a single receiving channel is used which is equipped with an electron commutator to switch the receiving antennas in pairs. A converted signal from the transmitter serves as a heterodyne voltage. Orig. art. has: 1 figure.

V. The production of single crystals of the  $\text{Al}_2\text{O}_3\text{-Ga}_2\text{O}_3$  system. J. Mandy. *Fizika Kidayy* 80, 441-5 (1958). In the course of crystn. by the Verneuil method as much as 16%  $\text{Ga}_2\text{O}_3$  can be built into the corundum lattice. On crystg. no solid soln. of the phase  $\text{GaAlO}_4$ , stable at lower temps., was observed. The phys. properties and lattice dimensions of the mixed crystals obtained exhibit a gradual transition towards  $\alpha\text{-Ga}_2\text{O}_3$ . As a solitary phase the  $\beta$  modification is invariably produced. The growing of pure single crystals of  $\text{Ga}_2\text{O}_3$  is impossible without using an intensely oxidizing atm. The color of the crystals is influenced by the Ga content only at higher temps. P. M. R.

POL/39-59-7/8-13/24

TITLE: Quality Steel Production in Poland in Numbers

PERIODICAL: Hutnik, 1959, Nr 7-8, pp 319-321 (POL)

ABSTRACT: By the term quality steel is meant: all high quality carbon steels, structural alloy steels, steel for tool making, stainless, refractory and anti-corrosive steel. The years for which the figures are given are 1956, 1957 and 1958. Special steels made for the armaments industry are not included in the present statistics. Table 1 shows how orders for rolled steel products increased between 1956 and 1958. The types of steel itemized in column 1 are: structural steel, steel for tool-making, acid-resistant and refractory steel, other steels with special physical qualities, sheet steel for generators and sheet steel for transformers. The figures are all given in tons. Table 2 gives figures (in tons) for quality structural steels. In column 1 they are grouped as follows: carbon steels, alloy steels (8 types), total for alloy steels

Card 1/3

Quality Steel Production in Poland in Numbers POL/39-59-7/8-13/24

not containing Ni, Mo and V, 3 types of alloys containing Mo and V and their total production, total figures for steels not containing Ni, alloys containing up to and over 2% Ni, total figures for alloys containing Ni, finally totals for all alloy structural steels and totals for all quality structural steels. Table 3 shows total orders and percentages of alloy steels destined for carburization. The 4 types given are: without Ni, Mo and V, with Mo and V, with up to 2% Ni and with over 2% Ni. Table 4 shows total orders and percentages of the same 4 types of alloy steels, destined for thermal treatment. Table 5 shows total orders in tons of various types of high-quality rolled steel, the following types being itemized in column 1: steel for tool making and cutting; carbon steel; alloy steel; acid-resistant and refractory; total of last two items in table; alloys without Ni and containing up to 4% Ni; finally, alloys containing over 4% Ni. There are about 250 types of quality steels produced in Poland, to which must be added, of course, about 70 varieties of ordinary steel and about

Card 2/3

Quality Steel Production in Poland in Numbers POL/39-59-7/8-13/24

50 types of cast steel. The number of varieties produced is increasing steadily. The author notes here that foreign varieties are often unnecessarily copied since almost identical varieties are being produced at home and the introduction of new types only requires added expenditure caused by new methods of treatment, new tests etc. The author also calls for a more rational policy of making orders for steel from the industry which cannot operate profitably if orders are too small. In turn, the industry must be able to supply the home market with the widest possible range of products. There are 5 tables.

AUTHOR: Mandybur, Kazimierz, Master of EngineeringTITLE: New Types of Steel and Products of Ferrous Metallurgy in the USSR

PERIODICAL: Wiadomości Hutnicze, 1960, No. 6, pp. 182 - 183

TEXT: The periodical "Standartizaciya" published details on the recently introduced technical conditions, the so-called "Chornaya Metallurgiya. Tekhnicheskiye Usloviya", worked out by the Central Scientific Research Institute of Ferrous Metallurgy in Moscow. The March issue of the above-mentioned periodical deals with the technical conditions worked out for new types of steel and products of ferrous metallurgy, i.e. 1) a 6-9-mm rolling mill for reinforcement steel of prestressed concrete; 2) new special sectional steel for railroad cars made from 09G2 manganese steel; 3) H25N5T<sup>b</sup>economy steel with 5% nickel content; 4) H17N4G7A<sup>a</sup>economy steel containing about 4% nickel, nitrogen, and about 7% manganese; 5) H17N5M2<sup>a</sup>steel; 6) MSt3,<sup>a</sup> 10,<sup>a</sup> 20K<sup>a</sup>boiler-sheet plated with acid-resistant 1H18N9T<sup>a</sup>and 1H18N12M2T<sup>a</sup>steel; 7) OH18N9T<sup>a</sup>and OH18N12M2T<sup>a</sup>acid-resistant steel sheet with a maximum carbon content of 0.08%; 8) 2H13 automatic chromium steel. Experiments on industrial level are also being carried out with the 12HMFR<sup>a</sup> and 12HMF heat-resistant steel containing boron. Technical conditions for a

New Types of Steel and Products of Ferrous Metallurgy in the USSR

A trial batch of products from steel with special physical properties, such as the N45MT alloy for bars, have also been worked out. Three types of thermocouple metals for temperatures ranging from -60 to +200°C, with linear expansion coefficients and resistance degrees are also described in the above-mentioned periodical. Details are also given on various types of wires for welding low-alloy pearlite steel and high-alloy austenitic steel. The periodical also gives the description of technical conditions for coarse sheet from 18G2 low-alloy steel, whose mechanical properties differ little from the Polish St52 steel, and for the 19G steel sheet with a thickness ranging from 8 to 10 mm. Reference is also made to the 20HGNR structural alloy steel for tractors and vehicles, replacing the 20HNR and 18HGNR steel.

334 - Data file with a circuit for a three-section LC filter.  
F. MANDY, *Prague, Czechoslovakia*, Dec 1967

0970.14 CZECH

It is found that at a given frequency, an *n*-derived LC filter section may be employed as a three-section circuit having a total shift of 0 to 50% if designed this consists of three LC sections, the resonant change in the parallel capacitance being  $\pm 4\%$ . The circuit was employed in a low-frequency oscillator (0.1 s to 10 MHz) having two phase-shifted outputs.

2783. *J. Acoustic Delay Lines. E. MANDYL. Slab  
procj Obror, 16, No. 1, 131-6 (1970) IN Czech.*

The system considered consists of two piezoelectric transducers (transmitter and receiver) and a delaying medium. Properties of the materials employed for the delay medium and those of the piezoelectric crystals are reviewed. A delay system consisting of two ADP, S-cut crystals, having a diameter of 15 mm and a thickness of 0.3 mm, and a 10 mm long Dural (Al-Mg) delay medium is described; the device had a bandwidth of 200 kc/s, centred around 3.3 Mc/s, and attenuation of 50 db, its delay being 3.2  $\mu$ sec. A similar system, with a 208 mm long delay medium proved unsuccessful, due to a very large attenuation.

5766 Compensation of the changes of the Boltzmann  
region emission currents in certain types of detectors  
E. MAROV. *Slabopriady Obzor*, 16, No. 7, 36-7  
1955 (in Russian).

Changes of the emission current caused by the temperature variation or ageing of the cathode can be compensated in a triode, which operates as a diode detector, by inserting a resistance between the grid and the anode. With an increase of the emission current the grid current increases; this causes an increase in the negative voltage of the grid and results in an effective reduction in the anode current. The value of the compensating resistance is chosen experimentally. A full-wave rectifier circuit having a stabilization factor of 15 is described. R. S. Slobodnick

631.176.23 ; 021.955.2

1150. THE THEORY OF DIODE DETECTION APPLIED TO  
THE MINIATURE VALVES. F. MENDOZA.

Slovapravny Odbor, Vol. 16, No. 6, 325-7 (1955). In Czech.

Considers a simple circuit in which a sinusoidal voltage of zero-impedance source is applied to the cathode of a diode, the anode being connected directly to earth. It is assumed that the current-voltage characteristic of the diode within the space-charge-limited region can be expressed either by the  $\frac{1}{2}$  power law, i.e.,  $I_a = K(V_a)^{1/2} I_d = KU^{1/2}$ , where  $K$  differs from  $K'$ , or by the fundamental and direct current components at the output are derived. These are plotted and compared with the experimental data. It is concluded that the  $\frac{1}{2}$  power law provides a good approximation also in the case of miniature valves, except in the Boltzmann current region.

Title : Effect of Space Charge on the Properties of Vacuum Tubes

Orig Pub : Slaboproudny obzor, 1956, 17, No 4, 194-197

Abstract : An analysis of the effect of space charge on the characteristics of vacuum tubes, particularly in the region of the initial current. The value of the retarding potential is calculated, starting with a Maxwellian distribution of the electron velocities of the electrons emitted from the cathode. The value of the retarding potential is a measure of the influence of the space charge, since the work function of the cathode with respect to the anode is increased by this quantity. Bibliography, 5 titles.

Title : Apparatus for the Measurement of the Noise Temperature of Silicon Crystals.

Orig Pub : Slaboproudny obzor, 1958, 19, No 2, 67-72

Abstract : The author considers a matching four-terminal network between the output of a detector chamber and the input of an intermediate frequency amplifier (the so-called Roberts circuit). The operation of this reactive four-terminal network is analyzed in detail and the possibility of an error in the measurement of the noise temperature due to the spread in the valence of the output impedances of the mixing detectors is estimated. Nomograms are given for the calculation of the capacitances and inductances of the Roberts circuit in the range from 10 to 100 Mcs for medium values of the output resistances from 100 to 1,000 ohms. The structural data of the apparatus for the measurement of the noise temperature of silicon crystals are briefly described.
